Antennas Launch and Intercept Radio Waves

• It’s a Transducer
• Converts Electro-Magnetic Energy to Current in an Electrical Circuit.
• And Vice Versa
Engineering is not a Four-Letter Word

• Make measurements.
• Make decisions.
• Repeat as necessary.

Designing and building usable antennas is a lot easier than designing radios.
Testing

• Building a good antenna system is an experimental proposition. Careful testing is essential.
• Arrange an A-B switch to compare your new antenna to the old "reference" antenna.
• It's usually best to work in daylight when atmospheric noise is lower and ground-wave signals are available. (minimum fading)
• Chose a marginal AM station and work for improved reception. (In my case WMTR, 5KW, 21 miles.)
• A communications receiver with an S-meter is helpful but not essential.
Fig. 30-24.—A typical example of an indoor aerial installed in a location full of interference. Both the indoor aerial, the lead-in and the ground wires run right through the strong interference zone and all of them pick up the disturbances. Noisy reception is bound to result.
Loops

- Respond only to the magnetic field.
- Household interference is generally an electrical field.
- Tuned: part of the radio front end.
- Less pickup than outdoor wire.
- Needs a high-gain receiver, i.e. superheterodyne.

Take It Aboard
So, why don’t we see many loops between 1930 and 1940?

- **Short-Wave!!**
  - Outside wire antennas remained the standard.
  - Sophisticated designs appear on the market.

![RCA Spiderweb](image)

**INSTALL A GENERAL ELECTRIC "V-DOUBLET" ALL-WAVE ANTENNA FOR SUPERIOR RECEPTION**
Loops

- Respond only to the magnetic field.
- Household interference is generally an electrical field.
- Usually tuned:
  - Part of the radio front end.
  - External control on the antenna.
- Broad-band (untuned) Active Loops are possible.
Homebrew Tuned Loops

SkyWaves Basic BCB Loop Antenna

This is a simple loop antenna that will improve the performance of almost any radio. Construction is quite simple, the wire is simply woven onto the plywood. About 135 feet of wire is used, 25 for every turn of each coil is wound in the same direction. Draw some arrows to remind yourself. The antenna is intended to be mounted in a vertical orientation, and should be rotated to achieve best reception. The mounting arrangement is left to the builder.

Insert a short scrap of wire in the knot after every two turns to achieve proper spacing.

Schematic and diagram of the loop antenna.
Homebrew Tuned Loops

Even a caveman can do it!

Simple Loop Antenna

4 Turns

Ferrite Rod Antenna

Twisted Pair to Radio

Variable Capacitor

Use antenna rod and variable cap (approx. 365pF) from 1950’s table radio. Wrap four turns of hook-up wire around center of rod. Twist leads (3-6 feet), and attach to antenna and ground terminals of your radio.
Improving the signal to noise ratio

Fig. 30-25.—A typical example of an outdoor aerial installation in which part of the aerial and the entire lead-in and ground leads are in the strong interference zone localized about the building. Since only a small proportion of the antenna system lies in a noise-free zone the signal-to-noise ratio will be low and noisy reception will result.

Fig. 30-26.—Lengthening the aerial wire as shown here, often improves the signal-to-noise ratio, for it adds more wire which picks up signal impulses but no noise impulses, since it lies outside of the interference zone.

GENERAL ELECTRIC V-DOUBLET

INSTALL A GENERAL ELECTRIC "V-DOUBLET" ALL-WAVE ANTENNA FOR SUPERIOR RECEPTION
Probe Antennas

- Use a small antenna, in an advantageous position, to capture a small sample of the desired signal.
- Make up the difference with a wind-band amplifier before the receiver.
- Loops: Sample the magnetic field.
- Whips: Sample the electrical field.
Commercial Active Whip

Universal Radio
NTi GA3005
Wideband Antenna
Order #1343

N3FRQ Active Ferrite Loop

Adjust source resistor for 25mA. (2.5V across the 100-ohm resistor in the power feed.)
Let Your Radio Play!
A conductor exposed to electromagnetic waves will absorb energy, causing an alternating current to flow in the conductor.

A conductor carrying an alternating electric current will radiate energy as electromagnetic waves.
The Hertzian Antenna or Dipole

Fig. 9.—A Hertzian oscillator (AB) charged by an induction coil I.

Figure 7. The Resonant Antenna
The greatest amount of current flows in the antenna when it is resonant. The shortest conductor that is self-resonant at a given frequency is one that is about a half-wavelength long. The reflection pattern on the antenna creates a standing wave of both voltage and current. The half-wave, center-fed antenna is often called a "doublet."
The Marconi Antenna
Connection to the Receiver

- You know what to do in this case.
- “G” is generally connected to chassis ground.
Many Multi-Band Sets

- These radios were designed to directly support balanced antenna feedlines.
- Add a jumper for an unbalanced feed.
Anything is Better than Nothing
Considerations

• **Problem:**
  – A half wavelength at 1500 кHz is over 300 feet.
  – A quarter wavelength at 600 кHz is over 375 feet.

• **The Saving Grace:**
  – Because background noise is high, and receivers are fairly sensitive, a receiving antenna does not need to be highly efficient.
  – Signal to noise ratio is far more important than absolute signal level.
  – A modest size skywire can give excellent results.
The Interference Zone

Fig. 30-4.—How an electrical device located in one part of a building can produce electrical interference part of which \( (I_c) \) is conducted directly through the electric light wiring to radio receivers operating from the same lighting line; the other part \( (I_R) \) may be radiated either directly from the device or from the electric light circuit wiring in the building to the aerial, lead-in and ground wires of the receiver, inducing interference voltages in them. These are heard in the radio receiver as disturbing noises of a certain character depending upon the nature of the interfering device (see Art. 30-16).
With shielded lead in

Fig. 30-28.—(A) The various capacities which exist between the aerial, ground, lead-in and shield in a shielded lead-in antenna system. (B) How the lower end of the shield may be connected to ground through a resistance (or choke) to reduce local oscillations of noise current in the shield circuit.
The Doublet Antenna

- Two random wires balanced above ground.
- Noise picked up by the feedline is cancelled out.
- Performance drops off drastically below the half-wave resonate frequency.
- Great for Short Wave.
- No very good for BCB.

**Fig. 30-46.** — How the noise voltages induced in a parallel-feeder lead-in are cancelled out in the primary impedance-matching transformer. The signal voltages induced in the two halves of the doublet are additive.
Fig. 30-53.—The circuit arrangement of the double-doublet aerial, the antenna impedance-matching transformers, the twisted-wire transmission line, and the receiver coupling transformer for the system shown in Fig. 30-52. (RCA DeLuxe Double-Doublet Antenna System.)
Probe Antennas

• Sample the Electromagnetic field with a small, inefficient antenna, and make up the difference with an amplifier.
• Loops: sample the electrical field of the available signal, and ignore the electrical field.
• Rods: E-field probe.
Rods
(E-field Probes)

• Much, much shorter than the wavelength.
Ratio of these two windings establishes the voltage gain. Reducing the source winding to one turn increases the gain to 5, etc.

Use unity gain with 8' whip.

All cores Amidon BN-43-202

Adjust source resistor for 25mA. (2.5V across the 100-ohm resistor in the power feed.)

Frequency range approx. 100Khz to 30MHz.

N3FRQ Active Antenna

Al Klase - 13 Jun 05
A lot of us have acquired some really nice radios from the 1930’s, and then hang three feet of wire down the back of the table for an antenna. In this presentation we’ll take a look at antennas systems in general with an eye to modern solutions such as active antennas, that better fit a 21st Century life style. Both commercial and homebrew setups will be considered.
